CS21 Lecture 15

1

## Outline

- Gödel Incompleteness Theorem

(midterm due Wednesday  
at the beginning of class)

February 10, 2014

CS21 Lecture 15

2

## Gödel Incompleteness Theorem

February 10, 2014

CS21 Lecture 15

3

## Background

- Hilbert's program (1920's):
  - formalize mathematics in axiomatic form
  - derive **all** true statements “mechanically” from initial axioms
  - would put mathematicians out of business!
  - very influential proposal
- to start: try for all true statements about the natural numbers (“number theory”)

February 10, 2014

CS21 Lecture 15

4

## Background:

- Kurt Gödel (1931): it is not possible!
- no formalization of number theory can prove all true statements
- stunning result
- considered one of greatest 20<sup>th</sup> century achievements in mathematics

February 10, 2014

CS21 Lecture 15

5

## Background

- We will prove using:
  - RE languages and non-RE languages
  - reductions
- Idea:
  - set of all theorems is RE
  - set of all true statements is not RE
- This kind of proof of Gödel's result attributed to Turing (1937).

February 10, 2014

CS21 Lecture 15

6

# Number Theory

- formal language to express properties of  $\mathbf{N} = \{0, 1, 2, 3, \dots\}$
- allowable symbols: parentheses, and
  - variables  $x, y, z, \dots$  ranging over  $\mathbf{N}$
  - operators  $+$  (addition) and  $*$  (multiplication)
  - constants 0 (additive id) and 1 (mult. identity)
  - relation = (equality)
  - quantifiers  $\forall$  (for all) and  $\exists$  (exists)
  - propositional operators  $\wedge$  (and)  $\vee$  (or)  $\neg$  (not)  $\Rightarrow$  (implies)  $\Leftrightarrow$  (iff)

7

# Number Theory

- can formalize syntax of allowable formulas (skip)
- defining comparison relations:

$$-x \leq y \equiv \exists z \ x + z = y$$

$$-x < y \equiv \exists z \, x + z = y \wedge \neg (z = 0)$$

8

# Number Theory

- Other natural concepts we will need:
  - quotient  $q$  and remainder  $r$  when divide  $x$  by  $y$ 

$$\text{INTDIV}(x, y, q, r) \equiv x = qy + r \wedge r < y$$
  - $y$  divides  $x$ 

$$\text{DIV}(y, x) \equiv \exists q \text{ INTDIV}(x, y, q, 0)$$
  - $x$  is even
 
$$\text{EVEN}(x) \equiv \text{DIV}(1+1, x)$$
  - $x$  is odd
 
$$\text{ODD}(x) \equiv \neg \text{EVEN}(x)$$

9

# Number Theory

- Other natural concepts we will need:
  - $x$  is prime  
 $\text{PRIME}(x) \equiv x \geq (1+1) \wedge \forall y ( \text{DIV}(y, x) \Rightarrow (y = 1 \vee y = x) )$
  - $x$  is a power of 2  
 $\text{POWER}_2(x) \equiv \forall y ( \text{DIV}(y, x) \wedge \text{PRIME}(y) ) \Rightarrow y = (1+1)$
  - $y = 2^k$  and  $k^{\text{th}}$  bit of  $x$  is 1  
 $\text{BIT}(x, y) \equiv \text{POWER}_2(y) \wedge \forall q \forall r ( \text{INTDIV}(x, y, q, r) \Rightarrow \text{ODD}(q) )$

10

# Number Theory

- $y = 2^k$  and  $k^{\text{th}}$  bit of  $x$  is 1
- $\text{BIT}(x, y) \equiv \text{POWER}_2(y) \wedge \forall q \forall r (\text{INTDIV}(x, y, q, r) \Rightarrow \text{ODD}(q))$

$y =$  100000000000  
 $x =$  1010111010111001001001

The binary string for  $x$  is partitioned into two parts,  $q$  and  $r$ , by a bracket underneath. Part  $q$  is the first 11 bits (10101110101) and part  $r$  is the remaining 11 bits (11001001001).

11

# Number Theory

- A **sentence** is a formula with no unquantified variables
  - every number has a successor:  $\forall x \exists y y = x + 1$  
  - every number has a predecessor:  $\forall x \exists y x = y + 1$  
  - not a sentence:  $x + y = 1$
- “number theory” = set of true sentences
  - denoted  $\text{Th}(\mathbf{N})$

12

## Proof systems

- Proof system components:
  - axioms (asserted to be true)
  - rules of inference (mechanical way to derive theorems from axioms)
- axioms for manipulating symbols (e.g.):
  - $(\phi \wedge \psi) \Rightarrow \phi$
  - $(\forall x \phi(x)) \Rightarrow \phi(1+1+1)$
  - $\forall x \forall y \forall z (x = y \wedge y = z \Rightarrow x = z)$
  - others...

February 10, 2014

CS21 Lecture 15

13

## Peano Arithmetic

- Peano Arithmetic: proof system for number theory. Axioms:
  - 0 is not a successor
 
$$\forall x \neg (0 = x + 1)$$
  - the successor function is one-to-one
 
$$\forall x \forall y (x+1 = y+1 \Rightarrow x = y)$$
  - 0 is an identity for +
 
$$\forall x x + 0 = x$$

February 10, 2014

CS21 Lecture 15

14

## Peano Arithmetic

- + is associative
 
$$\forall x \forall y x + (y + 1) = (x + y) + 1$$
- multiplying by zero gives 0
 
$$\forall x x * 0 = 0$$
- \* distributes over +
 
$$\forall x \forall y x * (y + 1) = (x * y) + x$$
- induction axiom
 
$$(\phi(0) \wedge \forall x (\phi(x) \Rightarrow \phi(x+1))) \Rightarrow \forall x \phi(x)$$

February 10, 2014

CS21 Lecture 15

15

## Peano Arithmetic

- rules of inference:

$$\text{modus ponens} \quad \frac{\phi \quad \phi \Rightarrow \psi}{\psi}$$

$$\text{generalization} \quad \frac{\phi}{\forall x \phi}$$

February 10, 2014

CS21 Lecture 15

16

## Proof systems

- a **proof** is a sequence of formulas
 
$$\phi_1, \phi_2, \phi_3, \dots, \phi_n$$
 such that each  $\phi_i$  is either
  - an axiom, or
  - follows from formulas earlier in list from rules of inference
- A sentence is a **theorem** of the proof system if it has a proof

February 10, 2014

CS21 Lecture 15

17

## Proof systems

- A proof system is **sound** if all theorems in that proof system are true (better have this)
- Peano Arithmetic (PA) is sound.

February 10, 2014

CS21 Lecture 15

18

## Proof systems

- A proof system is **complete** if all true sentences are theorems in that proof system
- hope to have this (recall Hilbert's program)

|  |   |
|--|---|
| true sentences<br>= $\text{Th}(\mathbf{N})$<br><br>theorems of a<br>complete proof<br>system | false sentences<br>= $\text{co-Th}(\mathbf{N})$ |
|--|---|

February 10, 2014

CS21 Lecture 15

19

## Incompleteness Theorem

**Theorem:** Peano Arithmetic is not complete.

(same holds for **any** reasonable proof system for number theory)

Proof outline:

- the set of theorems of PA is RE
- the set of true sentences (=  $\text{Th}(\mathbf{N})$ ) is not RE

February 10, 2014

CS21 Lecture 15

20

## Incompleteness Theorem

- Lemma: the set of theorems of PA is RE.
- Proof:
  - TM that recognizes the set of theorems of PA:
  - systematically try all possible ways of writing down sequences of formulas
  - accept if encounter a proof of input sentence  
(note: true for any reasonable proof system)

February 10, 2014

CS21 Lecture 15

21

## Incompleteness Theorem

- Lemma:  $\text{Th}(\mathbf{N})$  is not RE
- Proof:
  - reduce from co-HALT (show  $\text{co-HALT} \leq_m \text{Th}(\mathbf{N})$ )
  - recall co-HALT is not RE
  - what should  $f(\langle M, w \rangle)$  produce?
  - construct  $\gamma$  such that  $M$  loops on  $w \Leftrightarrow \gamma$  is true

February 10, 2014

CS21 Lecture 15

22

## Incompleteness Theorem

- we will define  $\text{VALCOMP}_{M,w}(v) \equiv \dots$  (details to come) so that it is true iff  $v$  is a (halting) computation history of  $M$  on input  $w$
- then define  $f(\langle M, w \rangle)$  to be:
 
$$\gamma \equiv \neg \exists v \text{ VALCOMP}_{M,w}(v)$$
- YES maps YES?
  - $\langle M, w \rangle \in \text{co-HALT} \Rightarrow \gamma \text{ is true} \Rightarrow \gamma \in \text{Th}(\mathbf{N})$
- NO maps to NO?
  - $\langle M, w \rangle \notin \text{co-HALT} \Rightarrow \gamma \text{ is false} \Rightarrow \gamma \notin \text{Th}(\mathbf{N})$
