## Outline

- “Challenges to the (extended) Church-Turing Thesis”
  - randomized computation
  - quantum computation

March 7, 2014

CS21 Lecture 25

2

## Challenges to the extended Church-Turing thesis

## Extended Church-Turing Thesis

- the belief that TMs formalize our intuitive notion of an efficient algorithm is:

The “extended” Church-Turing Thesis  
everything we can compute in time  $t(n)$  on a physical computer can be computed on a Turing Machine in time  $t(n)^{O(1)}$  (polynomial slowdown)

- randomized computation challenges this belief

March 7, 2014

CS21 Lecture 25

4

## Randomness in computation

- Example of the power of randomness
- Randomized complexity classes

March 7, 2014

CS21 Lecture 25

5

## Communication complexity

two parties: Alice and Bob  
function  $f: \{0,1\}^n \times \{0,1\}^n \rightarrow \{0,1\}$   
Alice holds  $x \in \{0,1\}^n$ ; Bob holds  $y \in \{0,1\}^n$

- **Goal:** compute  $f(x, y)$  while communicating as few bits as possible between Alice and Bob

- count number of bits exchanged (computation free)
- at each step: one party sends bits that are a function of held input and received bits so far

March 7, 2014

CS21 Lecture 25

6

## Communication complexity

- simple function (equality):  

$$EQ(x, y) = 1 \text{ iff } x = y$$
- simple protocol:
  - Alice sends  $x$  to Bob ( $n$  bits)
  - Bob sends  $EQ(x, y)$  to Alice (1 bit)
  - total:  $n + 1$  bits
  - (works for any predicate  $f$ )

March 7, 2014

CS21 Lecture 25

7

## Communication complexity

- Can we do better?
  - deterministic protocol?
  - probabilistic protocol?
    - at each step: one party sends bits that are a function of held input and received bits so far **and the result of some coin tosses**
    - required to output  $f(x, y)$  **with high probability** over all coin tosses

March 7, 2014

CS21 Lecture 25

8

## Communication complexity

**Theorem:** no deterministic protocol can compute  $EQ(x, y)$  while exchanging fewer than  $n+1$  bits.

- Proof:
  - “input matrix”:

March 7, 2014

CS21 Lecture 25

9

## Communication complexity

- assume 1 bit sent at a time (but proof works for general case)
- A sends 1 bit depending only on  $x$ :

March 7, 2014

CS21 Lecture 25

10

## Communication complexity

- B sends 1 bit depending only on  $y$  and received bit:

March 7, 2014

CS21 Lecture 25

11

## Communication complexity

- at end of protocol involving  $k$  bits of communication, matrix is partitioned into at most  $2^k$  combinatorial rectangles
- bits sent in protocol are the same for every input  $(x, y)$  in given rectangle
- conclude:  $f(x, y)$  must be constant on each rectangle

March 7, 2014

CS21 Lecture 25

12

## Communication complexity

Matrix for EQ:

- any partition into combinatorial rectangles with constant  $f(x,y)$  must have at least  $2^n + 1$  rectangles
- protocol that exchanges  $\leq n$  bits can only create  $2^n$  rectangles, so must exchange at least  $n+1$  bits.

March 7, 2014

CS21 Lecture 25

13

## Communication complexity

- Can we do better?
  - deterministic protocol?
  - **probabilistic protocol?**
    - at each step: one party sends bits that are a function of held input and received bits so far **and the result of some coin tosses**
    - required to output  $f(x, y)$  **with high probability** over all coin tosses

March 7, 2014

CS21 Lecture 25

14

## Communication complexity

- protocol for EQ employing randomness?
  - Alice picks **random prime  $p$**  in  $\{1 \dots 4n^2\}$ , sends:
    - $p$
    - $(x \bmod p)$
  - Bob sends:
    - $(y \bmod p)$
  - players output 1 if and only if:
 
$$(x \bmod p) = (y \bmod p)$$

March 7, 2014

CS21 Lecture 25

15

## Communication complexity

- $O(\log n)$  bits exchanged
- if  $x = y$ , always correct
- if  $x \neq y$ , incorrect if and only if:
 
$$p \text{ divides } |x - y|$$
- # primes in range is  $\geq 2n$
- # primes dividing  $|x - y|$  is  $\leq n$
- probability incorrect  $\leq 1/2$
- Randomness gives an exponential advantage!!**

March 7, 2014

CS21 Lecture 25

16

## Communication complexity

two parties: Alice and Bob  
 function  $f: \{0,1\}^n \times \{0,1\}^n \rightarrow \{0,1\}$   
 Alice holds  $x \in \{0,1\}^n$ ; Bob holds  $y \in \{0,1\}^n$

- **Goal:** compute  $f(x, y)$  while communicating as few bits as possible between Alice and Bob

**Example:**  $\text{EQ}(x, y) = 1$  iff  $x = y$

- Deterministic protocol: no fewer than  $n+1$  bits
- Randomized protocol:  $O(\log n)$  bits

March 7, 2014

CS21 Lecture 25

17

## Extended Church-Turing Thesis

- Common to insert “probabilistic”:

### The “extended” Church-Turing Thesis

everything we can compute **in time  $t(n)$**   
 on a physical computer can be  
 computed on a **probabilistic** Turing  
 Machine **in time  $t(n)^{O(1)}$  (polynomial slowdown)**

March 7, 2014

CS21 Lecture 25

18

## Randomized complexity classes

- model: **probabilistic Turing Machine**
  - deterministic TM with additional read-only tape containing “coin flips”

March 7, 2014

CS21 Lecture 25

19

## Randomized complexity classes

- RP** (Random Polynomial-time)
    - $L \in \text{RP}$  if there is a p.p.t. TM  $M$ :
      - $x \in L \Rightarrow \Pr_y[M(x,y) \text{ accepts}] \geq \frac{1}{2}$
      - $x \notin L \Rightarrow \Pr_y[M(x,y) \text{ rejects}] = 1$
  - coRP** (complement of Random Polynomial-time)
    - $L \in \text{coRP}$  if there is a p.p.t. TM  $M$ :
      - $x \in L \Rightarrow \Pr_y[M(x,y) \text{ accepts}] = 1$
      - $x \notin L \Rightarrow \Pr_y[M(x,y) \text{ rejects}] \geq \frac{1}{2}$
- “p.p.t” = probabilistic polynomial time

March 7, 2014

CS21 Lecture 25

20

## Randomized complexity classes

- BPP** (Bounded-error Probabilistic Poly-time)
  - $L \in \text{BPP}$  if there is a p.p.t. TM  $M$ :
    - $x \in L \Rightarrow \Pr_y[M(x,y) \text{ accepts}] \geq \frac{2}{3}$
    - $x \notin L \Rightarrow \Pr_y[M(x,y) \text{ rejects}] \geq \frac{2}{3}$

March 7, 2014

CS21 Lecture 25

21

## Randomized complexity classes

These classes may capture “efficiently computable” better than **P**.

One more important class:

- ZPP** (Zero-error Probabilistic Poly-time)
  - $\text{ZPP} = \text{RP} \cap \text{coRP}$
  - $\Pr_y[M(x,y) \text{ outputs “fail”}] \leq \frac{1}{2}$
  - otherwise outputs correct answer

March 7, 2014

CS21 Lecture 25

22

## RP, coRP, BPP

- from definitions:  $\text{ZPP} \subset \text{RP}$ ,  $\text{coRP} \subset \text{BPP}$

March 7, 2014

CS21 Lecture 25
